

UMA Financial Platform

Progress from the previous Excel-based process

Previous system	Current system and remaining work
Request preparation Requests were prepared in Excel, with calculations and supporting documents checked manually.	Guided forms calculate item totals, IGV and quotation payment splits automatically. This reduces manual calculation and keeps request information together.
Supplier registration Supplier information was collected in spreadsheets. RUC checks and verification required separate follow-up.	A central supplier register checks duplicates and retrieves SUNAT information in the background. Remaining work: monitor lookup delays and keep the local Padrón up to date.
Approvals and follow-up Staff relied on spreadsheet updates and direct follow-up to find out where a request was waiting.	Requests follow defined approval stages with recorded decisions. Remaining work: show who is responsible for each pending action and complete reviewer notifications across the platform.
Budget control Budget availability and spending had to be compared and updated across Excel records.	Annual and monthly budgets bring planned, committed, executed and paid amounts into one view. Remaining work: keep allocations current and review budget exceptions regularly.
Bank details and payments Bank information and payment status required manual recording, verification and matching.	Bank profiles have a review process, and payment preparation is separate from payment confirmation. Remaining work: complete bank-review alerts, certify bank formats and integrate bank responses.
Expense renditions and closing Expense reports and advances were tracked in Excel. Closing required consolidating records and checking supporting documents.	Structured rendition review, accounting checks and period locks support closing. Remaining work: strengthen overdue follow-up and complete direct SIRE submission integration.
Traceability and results Reconstructing a transaction meant gathering spreadsheets, documents and approval evidence.	Request histories, attachments and role permissions make transactions easier to trace. Remaining work: measure processing times and rework to confirm the practical gains.
